                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii mst gene as an example of a heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence encodes a mutant streptavidin protein isolated from Streptomyces avidinii where the residues ESAV at position 44-47 of the mature wild type sequence are replaced by VTAR. This sequence is used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant proteins or to determine/recover substances that contain streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or sensor chips. Notes of the proteins of the sequence does not appear in the specification but has been constanted from the wild-tree servers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Align seg 1/1 to: V34715

```

This sequence encodes a mutant streptavidin protein isolated from Streptomyces avidinii where the residues ESAV at position 44-47 of the mature wild type sequence are replaced by IGAR. This sequence is used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or sensor chips. NOTE: This sequence does not appear in the specification but has been constructed from the wild-type streptavidin sequence represented in V34714.

                     The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii mprost gene as an example of a heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           _documentation_block:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidini prost gene as an example of a heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.

A;Title: Close similarity among streptavidin-like, biotin-bin
A;Reference number: S57284; MUID:95359204
A;Accession: S57284
A;Accession: S57284
A;Molecule type: DNA
A;Residues: 1-183 <BAY>
A;Experimental source: Strain Tue2460
C;Superfamily: streptavidin
F;1-24/Domain: signal sequence #status predicted <MaT>
F;25-183/Product: streptavidin v1 #status predicted <MAT>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Total number of hits satisfying chosen parameters:
        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PARTER AREA REPORTED BY A REPORT OF THE PROPERTY OF THE PROPER
"Structural studies of binding site tryptophan mutants in the high-affinity streptavidin-biotin complex.";
J. Mol. Biol. 279:211-221(1998).
-!- FUNCTION: THE BIOLOGICAL FUNCTION OF STREPTAVIDIN IS NOT KNOWN.
FORMS A STRONG NON-COVALENT SPECIFIC COMPLEX WITH BIOTIN (ONE MOLECULE OF BIOTIN PER SUBUNIT OF STREPTAVIDIN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).

SUBUNIT: HOMOTETRAMER.

TISSUE SPECIFICITY: SYNTHESIZED IN HEN OVIDUCT AND CONCENT EGG WHITE (WHERE IT REPRESENT 0.05% OF THE TOTAL PROTEIN).

SIMILARITY: BELONGS TO THE AVIDIN/STREPRAVIDIN FAMILY.

-I- FUNCTION: THE S-LAYER IS A PARACRYSTALLINE MONO-LAYERED ASSEMBLY
OF PROTEINS WHICH COAT THE SURFACE OF BACTERIA.

-I- SUBCELLULAR LOCATION: CELL WALL. THIS BACTERIUM IS COVERED BY A
S-LAYER WITH HEXAGONAL SYMMETRY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cell wall; S-layer; Calcium-binding INIT_MET 0 0 SEQUENCE 1025 AA; 98209 MW; AFC
